   Recent developments

Tying it all together with ONELAB

Conclusions and perspectives
Some background

• I am a professor at the University of Liège in Belgium, where I lead a team of about 15 people in the Montefiore Institute (EECS Dept.), at the intersection of applied math, scientific computing and engineering physics

• Our research interests include modeling, analysis, algorithm development, and simulation for problems arising in various areas of engineering and science

• Current applications: low- and high-frequency electromagnetics, geophysics, biomedical problems

• We write quite a lot of codes, some released as open source software: https://gmsh.info, https://getdp.info, https://onelab.info
Gmsh, GetDP & ONELAB

- Gmsh ([https://gmsh.info](https://gmsh.info)) is a 3D finite element mesh generator with a built-in CAD engine and post-processor
  - Joint work with J.-F. Remacle at UCLouvain, with important contributions from J. Lambrechts, K. Hillewaert, M. Pellikka, A. Johnen, H. Si, A. Royer, C. Marot, I. Badia, T. Toulorge, M. Reberol, ...

- GetDP ([https://getdp.info](https://getdp.info)) is a general finite element solver using mixed finite elements
  - Joint work with P. Dular at ULiège, with important contributions from J. Gyselinck, R. Sabariego, M. Asam, B. Thierry, K. Jacques, F. Henrotte, G. Demésy, ...

- ONELAB ([https://onelab.info](https://onelab.info)) is an abstract interface for sharing information between codes
Some numbers

Today, Gmsh, GetDP and ONELAB represent about 500k lines of C++ code

- still only 3 core developers; about 100 with $\geq 1$ commit
- about 1,300 registered users on the development site https://gitlab.onelab.info
- about 20,000 downloads per month (70% Windows)
- about 800 citations per year – the Gmsh paper is cited about 5000 times
- Gmsh has probably become one of the most popular (open source) finite element mesh generators?
Download the ONELAB software bundle from https://onelab.info
Open models/Superconductors/helix.pro with Gmsh
An overview of Gmsh
What is Gmsh?

- Gmsh (https://gmsh.info) is a 3D finite element mesh generator with a built-in CAD engine and post-processor
- Open source (GNU GPL v2+)
- Includes a graphical user interface (GUI)
- Can be used as a standalone software or as a library (C++, C, Python or Julia)
- Can drive any simulation code interactively through ONELAB
~ 20 years of Gmsh development in 1 minute
A warm thank you to all the contributors!
Gmsh - A little bit of history

- Gmsh was started in 1996, as a side project
- 1998: First public release
- 2003: Open sourced under GNU GPL
- 2006: OpenCASCADE integration (Gmsh 2)
- 2009: IJNME paper and switch to CMake
- 2012: Curvilinear meshing and quad meshing
- 2013: Homology and ONELAB solver interface
- 2015: Multi-threaded 1D and 2D meshing (coarse-grained)
- 2017: Boolean operations and switch to Git (Gmsh 3)
- 2018: C++, C, Python and Julia API (Gmsh 4)
- 2019: Multi-threaded 3D meshing (fine-grained), robust STL remeshing
- 2021: GmshFEM, Quasi-structured quad meshing
Gmsh - Strategic choices

• Design goals: fast, light and user-friendly
  • Written in simple C++
  • GUIs: FLTK (desktop), UIKit (iOS), Android
  • OpenGL graphics
  • Highly portable (OSes & compilers)
  • Easy to distribute & install: zero dependencies on installation

• Handling of numerous third party libraries
  • Build system based on CMake – everything is optional
  • Some libs integrated and redistributed directly in gmsh/contrib (HXT, BAMG, Metis, Concorde, ...)

• Funding
  • Hobby until 2006, then industry, Wallonia, Belgium & EU
Gmsh - Strategic choices

- Community infrastructure
  - Our own (using GitLab) to enable public/private parts ([https://gitlab.onelab.info/gmsh/gmsh](https://gitlab.onelab.info/gmsh/gmsh))
  - Continuous integration and delivery (CI/CD) of Gmsh app and Gmsh SDK on Windows, Linux and macOS
  - Web site ([https://gmsh.info](https://gmsh.info)) with documentation, tutorials, etc.
  - Scientific aspects of algorithms detailed in journal papers

- Licensing
  - Gmsh is distributed under the GNU General Public License v2 or later, with exceptions to allow for easier linking with external libraries
  - We double-license to enable embedding in commercial codes
Gmsh - Basic concepts

• Gmsh is based around four modules: Geometry, Mesh, Solver and Post-processing
• Gmsh can be used at 3 levels
  • Through the GUI
  • Through the dedicated .geo language
  • Through the C++, C, Python and Julia API
• Main characteristics
  • All algorithms are written in terms of abstract model entities, using a Boundary REPresentation (BREP) approach
  • Gmsh never translates from one CAD format to another; it directly accesses each CAD kernel API (OpenCASCADE, Built-in, ...)

13
Gmsh - Basic concepts

The goal is to deal with very different underlying data representations in a transparent manner
Gmsh - Geometry module

Under the hood, 4 types of model entities are defined:

1. Model points $G_i^0$ that are topological entities of dimension 0
2. Model curves $G_i^1$ that are topological entities of dimension 1
3. Model surfaces $G_i^2$ that are topological entities of dimension 2
4. Model volumes $G_i^3$ that are topological entities of dimension 3
Gmsh - Geometry module

- Model entities are topological entities, i.e., they only deal with adjacencies in the model; a bi-directional data structure represents the graph of adjacencies

\[ G^0_i \Rightarrow G^1_i \Rightarrow G^2_i \Rightarrow G^3_i \]

- Any model is able to build its list of adjacencies of any dimension using local operations

- The BRep is extended with non-manifold features: adjacent entities, and embedded (internal) entities

- Model entities can be either CAD entities (e.g. from the built-in or OpenCASCADE kernel) or discrete entities (defined by a mesh, e.g. STL)
The geometry of a CAD model entity depends on the solid modeler kernel for its underlying representation. Solid modelers usually provide a parametrization of the shapes, i.e., a mapping:

\[ \mathbf{p} \in \mathbb{R}^d \mapsto \mathbf{x} \in \mathbb{R}^3 \]

1. The geometry of a model point \( G^0_i \) is simply its 3-D location \( \mathbf{x}_i = (x_i, y_i, z_i) \)
2. The geometry of a model curve \( G^1_i \) is its underlying curve \( C_i \) with its parametrization \( \mathbf{p}(t) \in C_i, \ t \in [t_1, t_2] \)
3. The geometry of a model surface \( G^2_i \) is its underlying surface \( S_i \) with its parametrization \( \mathbf{p}(u, v) \in S_i \)
4. The geometry associated to a model volume is \( \mathbb{R}^3 \)
Point $p$ located on a curve $C$ that is itself embedded in a surface $S$
Gmsh - Geometry module

Operations on CAD model entities are performed directly within their respective CAD kernels:

- There is no common internal geometrical representation
- Rather, Gmsh directly performs the operations (translation, rotation, intersection, union, fragments, ...) on the native geometrical representation using each CAD kernel’s own API
Gmsh - Geometry module

Discrete model entities are defined by a mesh (e.g. STL):

- They can be equipped with a geometry through a reparametrization procedure
- The parametrization is then used for meshing, in exactly the same way as for CAD entities
Gmsh - Mesh module

- Gmsh implements several meshing algorithms with specific characteristics
  - 1D, 2D and 3D
  - Structured, unstructured and hybrid
  - Isotropic and anisotropic
  - Straight-sided and curved
  - From standard CAD data or from STL through reparametrization
- Built-in interfaces to external mesh generators (BAMG, MMG3D, Netgen)
Gmsh - Mesh module

Typical CAD kernel idiosyncrasies: seam edges and degenerated edges
Gmsh - Mesh module

- Mesh data is made of *elements* (points, lines, triangles, quadrangles, tetrahedra, hexahedra, ...) defined by an ordered list of their *nodes*
- Elements and nodes are stored (*classified*) in the model entity they discretize:
  - A model point will thus contain a mesh element of type point, as well as a mesh node
  - A model curve will contain line elements as well as its interior nodes, while its boundary nodes will be stored in the bounding model points
  - A model surface will contain triangular and/or quadrangular elements and all the nodes not classified on its boundary or on its embedded entities (curves and points)
  - A model volume will contain tetrahedra, hexahedra, etc. and all the nodes not classified on its boundary or on its embedded entities (surfaces, curves and points)
This mesh data structure allows to easily and efficiently handle the creation, modification and destruction of conformal finite element meshes.
Gmsh - Solver module

- Gmsh implements a ONELAB (https://onelab.info) server to pilot external solvers, called “clients”
- Example client: GetDP finite element solver (https://getdp.info)

- The ONELAB interface allows to call such clients and have them share parameters and modeling information
- Parameters are directly controllable from the GUI
Gmsh - Solver module

- The implementation is based on a client-server model, with a server-side database and local or remote clients communicating in-memory or through TCP/IP sockets
  - Contrary to most solver interfaces, the ONELAB server has no a priori knowledge about any specifics (input file format, syntax, ...) of the clients
  - This is made possible by having any simulation preceded by an analysis phase, during which the clients are asked to upload their parameter set to the server
  - The issues of completeness and consistency of the parameter sets are completely dealt with on the client side: the role of ONELAB is limited to data centralization, modification and re-dispatching
Gmsh - Post-processing module

- Post-processing data is made of *views*
- A view stores both display *options* and *data* (unless the view is an *alias* of another view)
- View data can contain several *steps* (e.g. to store time series) and can be either linked to one or more models (*mesh-based* data, as stored in `.msh` or `.med` files) or independent from any model (*list-based* data, as stored in parsed `.pos` files)
- Data is interpolated through arbitrary polynomial interpolation schemes; automatic mesh refinement is used for adaptive visualization of high-order views
- Various *plugins* exist to create and modify views
Gmsh - Post-processing module

- Cuts, iso-curves and vectors
- Elevation maps
- Streamlines
- Adaptive high-order visualization
Gmsh - Recent developments

- Constructive Solid Geometry
- Application Programming Interface (API)
- Multi-threaded meshing
- Robust STL remeshing based on parametrizations
- Quasi-structured quad meshing
Gmsh - Constructive Solid Geometry

Gmsh - Constructive Solid Geometry

demos/boolean/import.geo
Gmsh - API

Gmsh 4 introduces a new stable Application Programming Interface (API) for C++, C, Python and Julia, with the following design goals:

- Allow to do everything that can be done in .geo files
  - ... and then much more!
- Be robust, in particular to wrong input data (i.e. “never crash”)
- Be efficient; but still allow to do simple things, simply
- Be maintainable over the long run
To achieve these goals the Gmsh API

- is purely functional
- only uses basic types from the target language (C++, C, Python or Julia)
- is automatically generated from a master API description file
- is fully documented
Gmsh - API

Same boolean example as before, but using the Python API:

```python
import gmsh
gmsh.initialize()
gmsh.model.add("boolean")

R = 1.4; Rs = R*.7; Rt = R*1.25

gmsh.model.occ.addSphere(0,0,0,Rt, 2)
gmsh.model.occ.intersect([(3, 1)], [(3, 2)], 3)
gmsh.model.occ.addCylinder(-2*R,0,0, 4*R,0,0, Rs, 4)
gmsh.model.occ.addCylinder(0,-2*R,0, 0,4*R,0, Rs, 5)
gmsh.model.occ.addCylinder(0,0,-2*R, 0,0,4*R, Rs, 6)
gmsh.model.occ.fuse([(3, 4), (3, 5)], [(3, 6)], 7)
gmsh.model.occ.cut([(3, 3)], [(3, 7)], 8)

gmsh.model.occ.synchronize()
gmsh.model.mesh.generate(3)
gmsh.fltk.run()
gmsh.finalize()

demos/api/boolean.py
#include <gmsh.h>

int main(int argc, char **argv) {
    gmsh::initialize(argc, argv);
    gmsh::model::add("boolean");

    double R = 1.4, Rs = R*.7, Rt = R*1.25;

    std::vector<std::pair<int, int>> ov;
    std::vector<std::vector<std::pair<int, int>>> ovv;
    gmsh::model::occ::addBox(-R,-R,-R, 2*R,2*R,2*R, 1);
    gmsh::model::occ::addSphere(0,0,0,Rt, 2);
    gmsh::model::occ::intersect({{3, 1}}, {{3, 2}}, ov, ovv, 3);
    gmsh::model::occ::addCylinder(-2*R,0,0, 4*R,0,0, 4*R,0, Rs, 4);
    gmsh::model::occ::addCylinder(0,-2*R,0, 0,4*R,0, Rs, 5);
    gmsh::model::occ::addCylinder(0,0,-2*R, 0,0,4*R, Rs, 6);
    gmsh::model::occ::fuse({{3, 4}, {3, 5}}, {{3, 6}}, ov, ovv, 7);
    gmsh::model::occ::cut({{3, 3}}, {{3, 7}}, ov, ovv, 8);

    gmsh::model::occ::synchronize();

    gmsh::model::mesh::generate(3);
    gmsh::fltk::run();
    gmsh::finalize();
    return 0;
}
Gmsh - API

In addition to CAD creation and meshing, the API can be used to

- Access mesh data (getNodes, getElements)
- Generate interpolation (getBasisFunctions) and integration (getJacobians) data to build Finite Element and related solvers (see e.g. demos/api/poisson.py)
- Create post-processing views
- Run the graphical user-interface
- Build custom graphical user-interfaces, e.g. for domain-specific codes (see demos/api/prepro.py or demos/api/custom_gui.py) or co-post-processing via ONELAB
Gmsh - API

In order to make this API easy to use, we publish a binary Software Development Toolkit (SDK):

- Continuously delivered (for each commit in master), like the Gmsh app
- Contains the dynamic Gmsh library together with the corresponding C++/C header files, and Python and Julia modules

Download

Gmsh is distributed under the terms of the GNU General Public License (GPL):

- Current stable release (version 4.8.0), 2 March 2021:
  - Download Gmsh for Windows 64-bit, Windows 32-bit, Linux 64-bit, Linux 32-bit or MacOS
  - Download the source code
  - Download the Software Development Kit (SDK) for Windows 64-bit, Windows 32-bit, Linux 64-bit, Linux 32-bit or MacOS
  - Download both Gmsh and the SDK with pip: `pip install --upgrade gmsh`

Make sure to read the tutorials before sending questions or bug reports.

- Development version:
  - Download the latest automatic Gmsh snapshot for Windows 64-bit, Windows 32-bit, Linux 64-bit, Linux 32-bit or MacOS
  - Download the latest automatic source code snapshot
  - Download the latest automatic SDK snapshot for Windows 64-bit, Windows 32-bit, Linux 64-bit, Linux 32-bit or MacOS
  - Access the Git repository: `git clone https://gitlab.onelab.info/gmsh/gmsh.git`
  - Download the latest automatic snapshot of both Gmsh and the SDK with pip: `pip install --force-reinstall --no-cache-dir gmsh-dev`

- All versions: binaries and sources
Most meshing algorithms are now multi-threaded using OpenMP:

- 1D and 2D algorithms are multithreaded using coarse-grained approach, i.e. several curves/surfaces are meshed concurrently
- The new 3D Delaunay-based algorithm is multi-threaded using a fine-grained approach. It currently lacks several features (embedded entities, hybrid meshes, ...), which will eventually be supported

You need to recompile Gmsh with `-DENABLE_OPENMP=1` to enable this; then e.g. `gmsh file.geo -3 -nt 8 -algo hxt`
Gmsh - Multi-threaded meshing

AMD EPYC 2x 64-core
Gmsh - Robust STL remeshing

New pipeline to remesh discrete surfaces (represented by triangulations):

- Automatic construction of a set of parametrizations that form an atlas of the model
- Each parametrization is guaranteed to be one-to-one, amenable to meshing using existing algorithms
- New nodes are guaranteed to be on the input triangulation ("no modelling")
- Optional pre-processing (i.e. edge detection) to color sub-patches if sharp features need to be preserved

[P. A. Beaufort et al., JCP 2020]
Gmsh - Robust STL remeshing

Batman STL mesh
Automatic atlas creation: each patch is provably parametrizable by solving a linear PDE, using mean value coordinates
Gmsh - Robust STL remeshing
Gmsh - Robust STL remeshing

Automatic atlas creation, this time with feature edge detection
Gmsh - Robust STL remeshing

Remeshing with feature edge detection
CT scan of an artery: 101 patches created, most because of the large aspect ratio
Remeshing of a skull: 715 patches created for reparametrization; mesh adapted to curvature
Gmsh - Robust STL remeshing

Remeshing of an X-ray tomography image of a silicon carbide foam by P. Duru, F. Muller and L. Selle (IMFT, ERC Advanced Grant SCIROCCO): 1,802 patches created for reparametrization
Gmsh - Quasi-structured quad meshing

New experimental algorithm by [M. Reberol et al. 2021] that has just landed in the development version

Compute a (scaled) cross-field with multilevel diffusion
Gmsh - Quasi-structured quad meshing

Build a unstructured quadrilateral mesh with a frontal approach guided by the scaled cross field
Gmsh - Quasi-structured quad meshing

Pattern-based quadrilateral meshing and cavity remeshing to eliminate unnecessary irregular vertices while preserving the cross field singularities
The final quad mesh is very similar to the one obtained with the global parametrization approach and has the same number of irregular vertices.
Gmsh - Quasi-structured quad meshing

- “Block” model: 533 surfaces, 1584 curves, 261.5k vertices, 261.6k quads
- Average SICN quality: 0.87 (minimum: 0.11)
- 58 sec. (initial unstructured quad mesh) + 33 sec. (quasi-structured improvement) on Intel Core i7 4 cores
- Quasi-structured improvement reduces the number of irregular from 14.4k to 3.6k
An overview of GetDP
What is GetDP?

- GetDP ([https://getdp.info](https://getdp.info)) is a flexible finite element solver using mixed elements
- Open source (GNU GPL v2+); same community infrastructure as Gmsh
- Main feature: closeness between
  - the input data defining discrete problems (written in plain text .pro files), and
  - the symbolic mathematical expressions of these problems
- New models developed through .pro files — no compilation
- Highly portable: exact same .pro files on iPhone and 10,000 core supercomputer
GetDP - A little bit of history

- GetDP was started at the end of 1996
- 1998: First feature-complete release, binary-only; original paper
- 2002: Socket-based communication with Gmsh
- 2004: Open sourced under GNU GPL
- 2010: Major refactoring and move to C++ (GetDP 2)
- 2011: New default solvers based on PETSc and SLEPc
- 2012: ONELAB interface
- 2014: Parallel domain decomposition methods (GetDDM)
- 2015: Macros, run-time variables, Python and Octave interpreters
- 2017: Polynomial and rational nonlinear eigenvalue problems
- 2018: Curved meshes and enhanced Gmsh support (GetDP 3)
- 2020: Auto-similar trees of edges
GetDP - Basic concepts

In a .pro file, the weak formulation: Find $u(x) \in H^1_0(\Omega)$ such that

$$- \int_{\Omega} a(x) \nabla u \cdot \nabla u' \, d\Omega = \int_{\Omega} f(x) u' \, d\Omega, \quad \forall u' \in H^1_0(\Omega)$$

is transcribed as

Formulation{
  { Name MyFirstFormulation; Type FemEquation;
    Quantity {
      { Name u; Type Local; NameOfSpace H1_0; }
    }
    Equation {
      Integral { [ -a[] * Dof{d u}, {d u} ];
        In Omega; Integration I; Jacobian J; }
      Integral { [ -f[], {u} ]; In Omega; Integration I; Jacobian J; }
    }
  }
}
GetDP - Main features

- $H^1$, $H(\text{curl})$, $H(\text{div})$ and $L^2$ bases in 1D, 2D and 3D; first and second order for all element types; higher order for some
- Natural handling of non-local (global) quantities
- Circuit coupling
- Static, transient, harmonic, multi-harmonic resolutions
- Linear and nonlinear eigenvalue problems
- Easy coupling of fields and formulations, staggered or monolithic, e.g. for explicit Jacobian matrices of strongly coupled nonlinear problems
- Linear algebra through PETSc/SLEPc
- Built-in Python and Octave interpreters
- Flexible templating mechanism, allowing one to build a library of generic formulations
On top, over the blue background, the “user” objects that are sufficient to parameterize a problem once it has been templated.
GetDP - Group

- Link with the (physical groups) in a mesh
- Functions on groups: nodes, edges, tree of edges, ...

```plaintext
Group{
    Air = Region[1]; // link with physical group 1 in the mesh
    Core = Region[2];
    Gamma = Region[{3, 4}];

    Omega = Region[{Air, Core}]; // combining groups

    nodes = NodesOf[Omega]; // nodes of the elements in Omega
    edgesOfSpanningTree = EdgesOfTreeIn[Omega, StartingOn Gamma];
}
```
GetDP - Function

- Piecewise definitions
- Space-time dependent
- Physical characteristics, sources, constraints, ...

```plaintext
Function {
    // constants
    f = 50; mu0 = 4. e-7 * Pi;

    // piecewise functions
    mu[Air] = mu0;
    mu[Core] = mu0 + 1/(100 + 100 * ($1)^6); // argument ($1)

    // using a runtime variable
    TimeFct[] = Cos[2*Pi*f*$Time] * Exp[-$Time];
}
```
GetDP - FunctionSpace

- Basis functions (associated with nodes, edges, faces, ...) of various orders
- Coupling of fields and potentials
- Definition of global quantities (fluxes, circulations, ...)
- Essential constraints (boundary and gauge conditions, ...)

```
FunctionSpace{
    { Name H1; Type Form0; // discrete function space for H1_h
      BasisFunction {
        { Name wi; NameOfCoef fi; Function BF_Node; // P1 finite elements
          Support Omega; Entity NodesOf[All]; }
      }
      Constraint {
        { NameOfCoef fi; EntityType NodesOf; NameOfConstraint Dirichlet; }
      }
    }
}
```
// second-order version, using hierarchical functions
FunctionSpace{
    { Name H1; Type Form0;
        BasisFunction {
            { Name wi; NameOfCoef fi; Function BF_Node; // order 1
                Support Omega; Entity NodesOf[All]; }
            { Name wi2; NameOfCoef fi2; Function BF_Node_2E; // order 2
                Support Omega; Entity EdgesOf[All]; }
        }
        Constraint {
            { NameOfCoef fi; EntityType NodesOf; NameOfConstraint Dirichlet; }
            { NameOfCoef fi2; EntityType EdgesOf; NameOfConstraint Dirichlet2; }
        }
    }
}
Exact sequence of the de Rham Complex

$$\begin{align*}
H_h^1(\Omega) &\xrightarrow{\text{grad}_h} H_h(\text{curl}; \Omega) &\xrightarrow{\text{curl}_h} H_h(\text{div}; \Omega) &\xrightarrow{\text{div}_h} L^2(\Omega)
\end{align*}$$

preserved at the discrete level using Whitney elements. E.g. for $H_h(\text{curl}; \Omega)$:

```plaintext
FunctionSpace {
{ Name Hcurl_h; Type Form1; // discrete Hcurl_h
  BasisFunction {
    { Name se; NameOfCoef he; Function BF_Edge;
      Support Omega; Entity EdgesOf[All]; }
  }
  Constraint {
    { NameOfCoef he; EntityType EdgesOf; NameOfConstraint Dirichlet; }
  }
}
}
```

$$h = \sum_{e \in \mathcal{E}(\Omega)} h_e s_e \quad h \in W^1(\Omega)$$
Coupled Field-Potential

\[ h = \sum_{e \in \mathcal{E}(\Omega_c)} h_e s_e + \sum_{n \in \mathcal{N}(\Omega - \Omega_c)} \phi_n v_n \quad h \in W^1(\Omega) \]

FunctionSpace {
    { Name Hcurl_hphi; Type Form1;
        BasisFunction {
            { Name se; NameOfCoef he; Function BF_Edge;
                Support OmegaC; Entity EdgesOf[All, Not SkinOmegaC]; }
            { Name vn; NameOfCoef phin; Function BF_GradNode;
                Support OmegaCC; Entity NodesOf[All]; }
            { Name vn; NameOfCoef phic; Function BF_GroupOfEdges;
                Support OmegaC; Entity GroupsOfEdgesOnNodesOf[SkinOmegaC];}
        }
        Constraint {
            { NameOfCoef he; EntityType EdgesOf; NameOfConstraint h; }
            { NameOfCoef phin; EntityType NodesOf; NameOfConstraint phi; }
            { NameOfCoef phic; EntityType NodesOf; NameOfConstraint phi; }
        }
    }
}
Topologically Non-Trivial Domains

FunctionSpace {
  { Name Hcurl_hphi; Type Form1;  
    BasisFunction {
      ... // same as above
      { Name sc; NameOfCoef Ic; Function BF_GradGroupOfNodes;

  { NameOfCoef Icc; EntityType GroupsOfNodesOf; NameOfConstraint I; }  
  { NameOfCoef U; EntityType GroupsOfNodesOf; NameOfConstraint V; }  
}
}
Global Quantities

\[ v = \sum_{n \in N_v} v_n s_n + v_f \left( \sum_{n \in N_f} s_n \right) = \sum_{n \in N_v} v_n s_n + v_f s_f \]

FunctionSpace {
    { Name Hgrad_v_floating; Type Form0; 
      BasisFunction {
        { Name sn; NameOfCoef vn; Function BF_Node; 
          Support Domain; Entity NodesOf[All, Not SkinDomainC]; } 
        { Name sf; NameOfCoef vf; Function BF_GroupOfNodes; 
          Support Domain; Entity GroupsOfNodesOf[SkinDomainC]; } 
      } 
      GlobalQuantity {
        { Name GlobalElectricPotential; Type AliasOf; NameOfCoef vf; } 
        { Name GlobalElectricCharge; Type AssociatedWith; NameOfCoef vf; } 
      } 
    } 
}
GetDP - Constraint

- Boundary conditions (Dirichlet, periodic)
- Initial conditions
- Topology of circuits with lumped elements
- Other constraints on local and global quantities

```c
Constraint{
  { Name Dirichlet; Type Assign; // boundary conditions
    Case {
      { Region Surface0; Value 0; }
      { Region Surface1; Value 1; }
    }
  }
}
```
Network constraints and circuit coupling

Constraint{
  { Name ElectricalCircuit; Type Network;
    Case Circuit {
      { Region E1; Branch {1, 2}; }
      { Region R1; Branch {1, 3}; }
      { Region L1; Branch {3, 2}; }
      { Region C1; Branch {1, 2}; }
    }
  }
}

![Diagram of electrical circuit]
GetDP - Formulation

- Equation builder, with symbolic expression of weak forms
- Involves local, global and integral quantities based on function spaces

Formulation{
  { Name Maxwell_e; Type FemEquation;
    Quantity {
      { Name e; Type Local; NameOfSpace Hcurl_h; }
    }
    Equation {
      Integral { [ 1/mu[] * Dof{Curl e}, {Curl e} ];
        In Omega; Jacobian Jac1; Integration Int1; }
      Integral { DtDt [ epsilon[] * Dof{e}, {e} ];
        In Omega; Jacobian Jac1; Integration Int1; }
    }
  }
}

Find $e \in H_h(curl; \Omega)$ such that
$$(\mu^{-1} \text{curl } e, \text{curl } e') + \partial_t^2(\epsilon e, e') = 0, \quad \forall e' \in H_h(curl; \Omega)$$
Formulation { // handle complexity with loops, etc.
    { Name OSRC; Type FemEquation;
        Quantity {
            { Name psi; Type Local; NameOfSpace Hdiv_psi; }
            { Name w; Type Local; NameOfSpace Hdiv_w; }
            For j In{1:N}
                { Name phi~{j}; Type Local; NameOfSpace Hdiv_phi~{j}; }
            EndFor
            { Name nxh; Type Local; NameOfSpace Hdiv_nxh; }
        }
        Equation {
            Integral { [ ZO * OSRC_C0 []{N, th} * Dof{nxh}, {nxh} ];
                In Gama; Jacobian JSur; Integration I1; }
            Integral { [ -{psi}, {nxh} ];
                In Gama; Jacobian JSur; Integration I1; }
            For j In{1:N}
                Integral { [ ZO * OSRC_Aj []{j, N, th} * Dof{phi~{j}}, {nxh} ];
                    In Gama; Jacobian JSur; Integration I1; }
                Integral { [ Dof{phi~{j}}, {phi~{j}} ];
                    In Gama; Jacobian JSur; Integration I1; }
                Integral { [ -OSRC_Bj []{j, N, th} / keps[]^2 * Dof{d phi~{j}}, {d phi~{j}} ];
                    In Gama; Jacobian JSur; Integration I1; }
                Integral { [ 1 / keps[]^2 * Dof{d nxh}, {d phi~{j}} ];
                    In Gama; Jacobian JSur; Integration I1; }
            EndFor
        }
    }
}
GetDP - Jacobian

- Mapping from reference to real space
- Geometrical transformations (axisymmetry, infinite domains, ...)

```cpp
Jacobian{
  { Name Jac1;
    Case { // piecewise defined on groups
      { Region OmegaInf; Jacobian VolSphShell{Rint, Rext}; }
      { Region OmegaAxi; Jacobian VolAxi; }
      { Region All; Jacobian Vol; }
    }
  }
}
```
GetDP - Integration

- Various numeric and analytic integration methods
- Criterion-based selection

Integration {
  { Name Int1; Criterion Test[];
    Case {
      { Type Gauss;
        Case {
          { GeoElement Triangle; NumberOfPoints 3; }
          { GeoElement Tetrahedron; NumberOfPoints 3; }
        }
      } { Type Analytic; }
    }
  }
}
GetDP - Resolution

- Description of the sequence of operations to solve the problem
- Time stepping, nonlinear iterations, ...
- Coupled problems (e.g. magneto-thermal coupling)
- Link various resolution steps (e.g. pre-computation of source fields)

```plaintext
Resolution{
    { Name Parabolic;
        System {
            { Name A; NameOfFormulation Parabolic; }
        }
    Operation{
        InitSolution[A];
        TimeLoopTheta[tmin, tmax, dt, 1]{
            Generate[A]; Solve[A]; If[Save[]]{ SaveSolution[A]; }
        }
    }
}
```
GetDP - PostProcessing

- “Front-end” to computational data
- Piecewise definition of any post-processing quantity of interest
- Local or integral evaluation

PostProcessing {
  { Name magfields; NameOfFormulation Dynamic;
    Quantity {
      { Name b;
        Value {
          Local { [ -mu[] * {Grad phi} ]; In OmegaCC; }
          Local { [ mu[] * {h} ]; In OmegaC; }
        }
      }
    }
  }
}
GetDP - PostOperation

- Evaluation of post-processing quantities (e.g. maps, sections, local or global evaluation, ...)
- Various output formats (e.g. space or time oriented, text, binary, ...)
- Output to disk or to memory as ONELAB parameters or Gmsh post-processing views

```plaintext
PostOperation {
  { Name Map_b; NameOfPostProcessing magfields;
    Operation {
      Print [ b, OnElementsOf Omega, File "b.pos", Format Gmsh ];
      Print [ b, OnLine {{0, 0, 0} {1, 0, 0}} {100}, File "b.txt" ];
    }
  }
}
```
GetDP - Recent developments

- Optimized Schwarz domain decomposition methods
- Vector energy-based hysteresis models
- Sensitivity calculations for shape and topology optimization
- Computational homogenization
- 3D moving band with symmetries
- Nonlinear eigenvalue problems
Massively parallel, distributed (MPI) optimized Schwarz domain decomposition methods for high-frequency wave scattering

[B. Thierry et al., CPC 2016]
GetDP - Energy-based hysteresis models

[K. Jacques et al., 2018]
Design sensitivity analysis for combined topology and shape optimization, based on the Lie derivative

[E. Kuci et al., SMO 2019]
GetDP - Computational homogenization

Massively parallel (MPI) Heterogeneous Multi-scale Method (HMM) for 3D lamination stacks

[I. Niyonzima et al, 2021]
GetDP - 3D moving band

Auto-similar trees for efficient and accurate 3D sliding surfaces
GetDP - Nonlinear eigenvalue problems

General polynomial and rational eigenvalue problems for the analysis of frequency-dispersive photonic open structures

[G. Demésy et al, CPC 2020]
Tying it all together with ONELAB
ONELAB - Context

- Economic
  - Growing importance of numerical simulation in education and industry
  - Prohibitive cost of commercial packages for a significant subset of potential users (SMEs, education, occasional use)

- Scientific
  - High quality of free/open-source software developed in universities and research centers
  - Sometimes ahead of commercial equivalents

- Practical
  - No user-friendly interface and/or sparse documentation (e.g. missing complete examples) for many (most?) open source Finite Element Analysis (FEA) codes
ONELAB - Objective

Develop an interface for integrating FEA software:

- allowing to share parameters between any code
- with an intuitive GUI allowing new users to get started and guided into the world of FE modeling—but with the possibility to construct sophisticated, upgradable, multi-code, multi-platform scripts for the specialized user
- and with the possibility to construct application-specific tools for both education and industry
ONELAB - Design

- Don't reimplement, interface the existing
- Make it as small, lightweight and as easy to maintain as possible (no solver-dependent code in the interface)
- Make it easy to provide templates, with interactive parameter modification
- ONELAB role = data centralization, modification and redispaching
- Issues of completeness and consistency of the parameter set are completely dealt with on the client (e.g. FEA software) side
ONELAB - Design

- Client-server:
  - Clients: CAD kernels, meshers, solvers, post-processors
  - Server: Gmsh + database
- Abstract interface:
  - The server has no a priori knowledge of the clients (no meta-language or exchange file format)
  - The client communicates with the server to define what information should be exchanged
  - Information is exchanged either directly in-memory, or through TCP/IP or Unix sockets
ONELAB - Sharing parameters

Sharing parameter through ONELAB in .geo and .pro files is as simple as:

```
DefineConstant[ N = { 50, Name "Input/Number of steps"} ];
```

In Python one can use the onelab.py module:

```
c = onelab.client()
N = c.defineNumber('Input/Number of steps', value=50)
```

Or one can directly use the Gmsh API, with JSON encoded data:

```
gmsh.onelab.set(""[

{  
  "type":"number",
  "name":"Input/Number of steps",
  "values":[50]
}
]
"
)
N = gmsh.onelab.getNumber('Input/Number of steps')
```
ONELAB - Tutorial

The best way to get started is the ONELAB tutorial:

- Examples of increasing complexity using both Gmsh and GetDP
- Used for teaching the “Modeling and design of electromagnetic systems” class at ULiège since 2018
Open tutorials/Electrostatics/microstrip.pro with Gmsh
ONELAB - Multiphysics example

Open models/Magmetomater/magnetometer.pro with Gmsh
ONELAB - Going further

- In addition to the tutorial, various models are available on
  https://gitlab.onelab.info/doc/models
- Shape and topology optimization examples are also available on
  https://gitlab.onelab.info/conveks/tutorials
- ONELAB has proved to be very useful in building application-specific codes
  for industry
  - Transformer design (Gmsh+GetDP+LTSpice), filter design (Gmsh+GetDP),
    busbar design (Gmsh+GetDP), behavior of structures subjected to fire
    (Gmsh+Safir), thermal laser skin treatment (Gmsh+GetDP+Elmer),
    building resistance (Gmsh+Code_Aster), ...
  - Using the Gmsh API allows one to create dedicated graphical user interfaces,
    with advanced interactivity for the selection of boundary conditions,
    specification of material properties, etc.
Conclusions and perspectives
Conclusions and perspectives

• Overview of Gmsh, GetDP and ONELAB
  • Modelling freedom (but some coding is necessary)
  • Accessibility, reproducibility and interoperability (free and open source)
  • Easy installation (binary distribution)
  • Encapsulated and scriptable
  • Successfully used both in academia and in industry
  • More “Swiss Army knife” than “bazooka”
  • Some open source alternatives: deal.II, dune-fem, FEMM, FEniCS, FreeFEM, NGSolve, Elmer, MFEM, ...

• Many exciting developments in the pipeline:
  • Meshing: improved curved mesh generation, hex-dominant meshes, boundary layers, ...
  • Solver: next-generation assembler GmshFEM, domain decomposition framework GmshDDM and full wave inversion code GmshFWI; GPU acceleration, ...
Post-Scriptum

• To download the ONELAB software bundle, including Gmsh and GetDP: https://onelab.info

• For fun, go to the
  • Google Play Store (if you are on Android)
  • Apple AppStore (if you are on iOS)
and download the ONELAB app: it contains a full-featured version of Gmsh & GetDP

... so you can impress your friends by solving finite element problems on your smartphone!
Thanks for your attention
